Card Production Standard Operating Procedure

1. Purpose

This SOP describes the operational process for card-production batch processing and recovery from failed or partially completed batches.

2. Standard Processing

A card-production batch processes eligible card records, performs database updates, generates the production output file and sends completion information to downstream services.

3. Batch Completion

A batch must only be considered successfully completed after all mandatory processing stages have finished successfully.

4. Database Failure Handling

If a database error or deadlock occurs, the current batch state must be verified before processing is restarted or retried.

5. Partial Processing

If a failure occurs after some records have already been processed, operations must identify which records were committed before any reprocessing is performed.

6. Duplicate Prevention

Reprocessing must not create duplicate card records, duplicate output files or duplicate downstream notifications.

7. File Generation

Production files must represent a successfully completed batch. Failed or partially processed batches must be reconciled before downstream file delivery.

8. Notifications

Completion notifications must only be generated when the corresponding processing stage has completed successfully. Duplicate notifications must be prevented.

9. Recovery

Recovery actions must verify database state, batch status, generated files and downstream processing before the batch is considered recovered.
